

Analysis Report

This report is structured as follows.

Contents

Frequency Tables	2
Descriptive Statistics.....	12
Conjoint Analysis.....	14
Overall Model	14
Models for Different Genders	14
Men	14
Models for City Sizes.....	16
Grobstradt.....	16
Grobe Grobstradt.....	16
Kleinstadt	17
Langemeide.....	18
Mittelstadt	18
Psychology Experience	19
No Psychology Experience	20
Comparison of Model Coefficients.....	21
Doctorate	21
Profession.....	23
Specialization 1	26
Specialization 2	26

Frequency Tables

The table below shows general frequencies of the times that a participant chose or did not choose a particular attribute.

Variable	Level	Not Chosen		Chosen	
		N	%	N	%
Profession	Facharzt für Psychiatrie und Psychotherapie	440	1.334	1299	3.937
	Heilpraktiker	4814	14.591	2072	6.280
	Heilpraktiker beschränkt auf das Gebiet der Psychotherapie	4414	13.379	2717	8.235
	Heilpraktiker für Psychotherapie	3607	10.933	3251	9.854
	Psychologe/Heilpraktiker für Psychotherapie	1879	5.695	3336	10.112
	Psychologischer Psychotherapeut	1342	4.068	3821	11.582
Doctorate	-	4799	14.546	4695	14.231
	Dr. med.	193	0.585	665	2.016
	Dr. phil.	4156	12.597	4546	13.779
	Dr. rer. medic.	3133	9.496	2132	6.462
	Dr. rer. nat.	4215	12.776	4458	13.512
Masters	-	8616	26.115	8677	26.300
	M.Sc.	7880	23.885	7819	23.700
Specialization.1	Achtsamkeit	2792	8.463	2668	8.087
	EMDR	5942	18.010	5101	15.461
	Integrative Psychotherapie	7762	23.527	8727	26.452
Specialization.2	Achtsamkeit	5962	18.071	5075	15.383
	EMDR	2719	8.241	2698	8.178
	Verhaltenstherapie	7815	23.688	8723	26.440

The following table contains frequencies for each categorical variable present in the data.

Category	Level	Count	Percentage
Gender	Divers	23	1.0
	Keine Angabe	9	0.4
	Männlich	173	7.6
	Weiblich	2065	91.0
Age_group	18 - 20 Jahre	51	2.2
	21 - 30 Jahre	653	28.8
	31 - 40 Jahre	834	36.7
	41 - 50 Jahre	493	21.7
	51 - 60 Jahre	202	8.9
	Über 60 Jahre	37	1.6
Marital_status	Geschieden	167	7.4
	In Partnerschaft lebend	639	28.2
	Ledig	785	34.6
	Verheiratet	666	29.4
	Verwitwet	12	0.5
City_size	Große Großstadt (über 500.000 Einwohner)	452	19.9
	Großstadt (100.000 - 499.999 Einwohner)	491	21.6
	Kleinstadt (5.000 - 19.999 Einwohner)	384	16.9
	Landgemeinde (unter 5.000 Einwohner)	397	17.5
	Mittelstadt (20.000 - 99.999 Einwohner)	544	24.0
Employment_status	Angestellt (Teilzeit)	617	27.2
	Angestellt (Vollzeit)	766	33.8
	Arbeitslos	99	4.4
	Rentner:in o.ä.	97	4.3

Category	Level	Count	Percentage
	Selbstständig	160	7.1
	Sonstiges	203	9.0
	Student:in	326	14.4
Education	Allgemeine Hochschulreife (Abitur)	301	13.3
	Berufsausbildung	530	23.4
	Fachhochschulreife	174	7.7
	Habilitation	2	0.1
	Hauptschulabschluss	30	1.3
	Mittlere Reife	200	8.8
	Ohne Schulabschluss	2	0.1
	Promotion	55	2.4
	Studienabschluss (Bachelor o.ä.)	479	21.1
	Studienabschluss (Master, Diplom, o.ä.)	495	21.8
Net_income	2.001 - 3.000 EUR	627	27.7
	3.001 - 4.000 EUR	324	14.3
	4.001 - 5.000 EUR	226	10.0
	5.001 - 6.000 EUR	137	6.0
	6.001 - 7.000 EUR	69	3.0
	Über 7.000 EUR	94	4.1
	Unter 2.000 EUR	789	34.8
Psych_experience	Ja	1827	80.9
	Nein	432	19.1
Psych_consideration	Ja, ich könnte es mir vorstellen	374	86.6
	Nein, ich könnte es mir nicht vorstellen	13	3.0
	Unsicher	45	10.4

Category	Level	Count	Percentage

Conjoint Analysis

The analysis was performed using R version 4.3.2 and the mlogit package, tailored for conjoint analysis. To fit the requirements of the mlogit package, the dataset was transformed into a long-format structure, with each row representing an alternative within the choice sets presented to respondents. The reshaped dataset comprised 32,992 observations, reflecting the choices made by 2,332 individuals across 10 distinct choice situations. Observations with missing values were discarded.

Overall Model

The model exhibited a Log lik of -9268 and an AIC of 18563. Significant findings indicate a preference hierarchy within the profession attributes, with "Heilpraktiker" being the least preferred (-2.352, $p < .001$), followed by various degrees of specialization within psychotherapy, showing a gradation of increasing preference. Doctorates in medical fields and psychology (e.g., "Dr. med.", "Dr. phil.", "Dr. rer. medic.", "Dr. rer. nat.") were positively valued, with "Dr. phil." showing a particularly strong preference (0.249, $p < .001$). Specializations in "Integrative Psychotherapie" and "Verhaltenstherapie" were highly valued (0.482 and 0.418, respectively, $p < .001$), suggesting a strong preference for these therapeutic approaches.

Models for Different Genders

Men

For men, the Log lik was -726.4558 with an AIC of 1480.912, indicating a model of good fit. Significant negative preferences were found for all professional categories except "Psychologischer Psychotherapeut," suggesting a generalized lower preference for these professions among men. Positive preferences were noted for doctoral titles and "Verhaltenstherapie" specialization (0.485, $p < .001$), with "Dr. rer. medic." receiving the highest positive estimate (0.827, $p < .001$).

For women, with a Log lik of -8373.165 and an AIC of 16774.33, the pattern of preference for professional categories was similar to the overall population, but with slightly different magnitudes. "Integrative Psychotherapie" and "Verhaltenstherapie" specializations remained highly preferred (0.493 and 0.413, respectively, $p < .001$).

Models for City Sizes

In larger cities ("Grobstradt"), preferences showed significant aversion to all professional categories with "Heilpraktiker" again being the least preferred (-2.511, $p < .001$). Specializations in "Integrative Psychotherapie" and "Verhaltenstherapie" were highly preferred, similar to overall trends.

In "Grobe Grobstradt," patterns were consistent with larger cities, but with no significant preference for "MastersM.Sc." and a notable preference for "Dr. phil." and "Dr. rer. medic.".

In smaller cities ("Kleinstadt"), a similar pattern emerged, with significant preferences for doctoral titles and specific therapeutic specializations, indicating these attributes' importance transcends urban and rural divides.

Grobstradt

For larger urban areas ("Grobstradt"), the model showed a Log lik of -2054.265 and an AIC of 4136.53. These indices suggest a good fit, indicating that the model effectively captures the preferences of individuals in these areas. The strong negative preferences for professional titles in "Grobstradt," alongside positive evaluations for higher academic achievements and specific therapeutic specializations, reflect an urban population that values formal education and proven therapeutic methods. The preferences for "Integrative Psychotherapie" (0.510, $p < .001$) and "Verhaltenstherapie" (0.530, $p < .001$) emphasize the importance of these approaches in addressing the complex mental health needs of urban residents.

Grobe Grobstradt

In "Grobe Grobstradt," with a Log lik of -1806.551 and an AIC of 3641.102, the model also demonstrates a good fit. The consistency in negative preferences for professional titles and positive

views on doctoral titles underlines a similar valuation of formal education in very large urban centers. The preference for "Dr. phil." (0.372, $p < .001$) and "Dr. rer. medic." (0.462, $p < .001$) highlights the urban populace's trust in academic credentials.

Kleinstadt

Conversely, in smaller cities ("Kleinstadt"), the model's Log lik of -1551.642 and an AIC of 3131.285 suggest that the model adequately captures preferences in these settings. The less pronounced negative preferences towards professional titles and the positive coefficients for educational achievements and therapeutic specializations indicate a more moderate perspective towards psychotherapeutic qualifications in less urbanized areas. This moderation suggests a potential openness to a wider range of psychotherapeutic professionals, provided they possess notable educational or specialization credentials.

Langemeide

The model fit for "Langemeide" demonstrated a Log Likelihood of -1544.501 and an AIC of 3117.002, indicating a reliable fit of the model to the data. The analysis reveals a strong negative preference for all professional titles, with "Heilpraktiker" receiving the most significant aversion (-2.442, $p < .001$). This suggests a critical perspective towards non-traditional psychotherapeutic qualifications in "Langemeide." Interestingly, "DoctorateDr. phil." was viewed favorably (0.217, $p = .012$), indicating an appreciation for academic credentials in the field of philosophy or psychology, which may be associated with higher trust or perceived competence in psychotherapeutic practice. Notably, "Specialization.1Integrative Psychotherapie" and "Specialization.2Verhaltenstherapie" were highly preferred (0.565 and 0.536, respectively, $p < .001$), underscoring the value placed on these therapeutic approaches. This preference may reflect an understanding of the efficacy of these therapies or a greater alignment with the health needs and cultural expectations of "Langemeide" residents.

Mittelstadt

For "Mittelstadt," the model showed a Log Likelihood of -2251.951 and an AIC of 4531.903, suggesting a good model fit. Similar to "Langemeide," there was a pronounced negative preference for professional titles indicative of non-traditional psychotherapeutic qualifications. The "Heilpraktiker" again faced the strongest rejection (-2.443, $p < .001$), highlighting skepticism towards alternative psychotherapeutic practitioners in medium-sized cities as well.

However, "DoctorateDr. phil." received a positive coefficient (0.147, $p = .040$), albeit less pronounced than in "Langemeide," still signaling respect for doctoral-level education in psychology or related fields. "Specialization.1Integrative Psychotherapie" and "Specialization.2Verhaltenstherapie" were again valued positively (0.403 and 0.291, respectively, $p < .001$), reflecting consistent preference patterns across city sizes for these specialized therapeutic approaches.

Psychology Experience

Among individuals with psychology experience, the model reported a Log lik of -7337.05 and an AIC of 14702.1, signifying a robust model fit that effectively captures the preferences within this group. The significant negative preferences for "Heilpraktiker" and its variations point to a discerning view towards these professional titles, likely reflecting a preference for more traditionally recognized qualifications in psychology. The positive valuation of "Dr. phil." (0.193, $p < .001$) and "Integrative Psychotherapie" (0.452, $p < .001$) among those with psychology experience suggests an appreciation for rigorous academic backgrounds and effective therapeutic methodologies.

No Psychology Experience

For those without psychology experience, with a Log lik of -1892.404 and an AIC of 3812.809, the model similarly captures the preferences effectively. The negative preferences for professional titles indicate skepticism towards alternative psychotherapeutic qualifications, even among those without formal psychology backgrounds. The strong positive coefficients for doctoral titles and "Integrative Psychotherapie" specialization highlight an overarching respect for formal education and specific therapeutic approaches, irrespective of personal experience in psychology.

Comparison of Model Coefficients

This section aims to present the statistical comparison of coefficients from different pairs of attribute levels included in the models presented in earlier sections.

A systematic statistical approach based on the z-test was adopted. This method utilizes the estimated coefficients and their associated standard errors directly from the regression model outputs.

For each model and attribute, pairwise comparisons between all possible pairs of categories were conducted. This entails comparing each category against all others within the same attribute to understand how each pair differs in terms of their influence on the dependent variable.

To determine if the differences between any two coefficients are statistically significant, the z-statistic was computed using the following formula:

$$Z = (\text{Coefficient1} - \text{Coefficient2}) / \sqrt{(\text{SE1}^2 + \text{SE2}^2)}$$

Here, Coefficient1 and Coefficient2 are the coefficients of two categories being compared, and SE1 and SE2 are the standard errors associated with these coefficients.

This z-statistic follows a standard normal distribution under the null hypothesis that there is no difference between the two coefficients.

From the z-statistic, the p-value is calculated, which is calculated using the cumulative distribution function of the standard normal distribution, reflecting the two-tail nature of the test.

The following tables present the results of the tests, separated by all models that were conducted. Each subsection contains a table for a given attribute. No tests were executed for Masters since only two categories were present on the original models.
