SAMPLE	

### **Sample Characterization**

In this survey, respondents provided insights into their travel expenses, attitudes towards sustainability, and familiarity with circular economy models in tourism. Most participants (32.9%) reported spending over  $2000 \in /\$$  on vacation, while a smaller proportion (23.2%) spent between 501 and  $1000 \in /\$$ . This indicates a tendency towards higher spending on travel among the respondents.

		Count	Column N %
What is the average cost of	0	1	1.2%
your vacation?	50 - 200 â,¬/\$	1	1.2%

Regarding sustainable travel behavior, the largest group (37.8%) was uncertain about their sustainability level, while 26.8% considered their travel rather sustainable. This reflects a significant level of awareness and interest in sustainable travel, although a substantial portion remains uncertain about their own practices.

When asked about the commitment of hotels, restaurants, and service providers to sustainability, the majority (36.6%) felt these entities are not committed enough, and 24.4% believe they do what is necessary. This suggests a critical view of the current efforts in the tourism industry to embrace sustainability.

In terms of encountering circular economy models in tourism, a significant portion of respondents (48.8%) have not yet encountered them, and 39.0% were unsure, indicating a lack of widespread exposure or awareness of these models in the tourism sector.

As for food-sharing apps, a majority (56.1%) were not familiar with them, yet 28.0% would consider using them during a trip, showing an openness to exploring sustainable options. The strong preference (59.8%) for seasonal offerings in food and restaurants signifies a positive attitude towards more environmentally conscious choices in dining.

When it comes to borrowing or renting items versus buying new ones, responses were evenly split between preferring to borrow/rent (25.6%) and buy (30.5%), indicating varied attitudes towards consumption practices while traveling.

Most respondents (84.1%) would use refillable bottles if their accommodation offered water stations, showcasing a high willingness to engage in simple sustainable practices.

Regarding factors preventing more support for circular economy-based offers, 45.1% were unsure, and 32.9% stated no obstacles, indicating either a lack of perceived barriers or a lack of awareness of these opportunities.

Demographically, the survey had a fairly balanced gender distribution, with a slight male majority (51.2%). The age range was diverse, but the largest group (43.9%) was over 60 years old, followed

by 25.6% in the 46 - 60 years bracket. This suggests that older age groups are more engaged in this survey.

Income levels varied, with the largest group (40.2%) earning between 2,001 and  $5,000 \in /\$$ , followed by 17.

1% each earning under 1,000 €/\$ or over 10,000 €/\$. Education levels were high, with 54.9% holding a Master's or Diploma degree.

The table presents the mean scores, standard deviations, and standard errors of the mean for various measures related to sustainable travel behavior and attitudes towards sustainability in tourism. These measures are set to be analyzed through factor analysis.

	Mean	Standard Deviation	Standard Error of Mean
Have you changed your travel behavior due to climate change?	3.512	1.381	.153
Is preserving the local economy, society, and nature during your trip important to you?	5.049	1.154	.127
Do you support hotels, restaurants, and service providers in implementing sustainable measures?	4.695	1.224	.135
Would second-hand furniture in your hotel room diminish your travel experience?	2.841	1.732	.191
Are you aware of the measures accommodations, restaurants and service-providers undertake for more sustainability?	3.305	1.608	.178
Do you wish for more transparency from accomodations, restaurants and service providers regarding sustainable measures?	4.817	1.218	.135
Are you aware of your ecological footprint when traveling?	3.171	1.632	.180
Would you like to know your ecological footprint when traveling?	4.220	1.678	.185
Are you aware of the impacts of food waste?	4.573	1.633	.180
Are you familiar with the circular economy and its various models?	3.549	1.686	.186
Are you interested in participating in activities and services related to circular economy (Recycling and reusing materials) during your trip?	4.500	1.416	.156
Would you like the option to have your leftovers packed and taken with you from restaurants?	5.000	1.370	.151
Would you have a problem if your leftovers were used later for other purposes?	3.780	2.183	.241
What do you think of the concept in hotels of only receiving fresh towels if they are left on the floor?	3.325	.952	.106
What do you think of circular economy models in tourism? What do you think of this concept? Refill dish	3.125 1.768	.788 .920	.105 .102

#### **Principal Component Analysis**

The project proceeded to find latent factors behind the survey items. For this, Principal Component Analysis was employed.

The results of the principal component analysis (PCA) and subsequent reliability tests in this study provide valuable insights into the structure and consistency of the survey data on sustainable travel behaviors and attitudes.

Initially, the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO) was .747, suggesting that the sample was adequate for PCA. Bartlett's Test of Sphericity was significant ( $\chi^2 = 390.186$ , df = 120, p < .001), indicating that the correlation matrix was not an identity matrix and was suitable for factor analysis.

#### KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of S	Sampling Adequacy.	15	.747
Bartlett's Test of Sphericity	Approx. Chi-Square		390.186
	df	0.0	120
	Sig.		.000

The PCA revealed a three-factor solution initially, explaining a total of 54.982% of the variance. The first factor accounted for 34.667%, the second for 10.942%, and the third for 9.373%.

Total Variance Explained

	I	nitial Eigenvalue	Extraction Sums of Squared Loadings			
		% of <b>(</b>	Cumulative		% of	Cumulative
Component	Total	Variance	%	Total	Variance	%
1	5.547	34.667	34.667	5.547	34.667	34.667
2	1.751	10.942	45.609	1.751	10.942	45.609
3	1.500	9.373	54.982	1.500	9.373	54.982
4	1.167	7.295	62.277	1.167	7.295	62.277
5	1.061	6.629	68.905	1.061	6.629	68.905
6	.964	6.025	74.930			
7	.852	5.327	80.257			
8	.627	3.922	84.178			
9	.539	3.369	87.547			
10	.509	3.181	90.729			
C11	.357	2.234	92.963			
12	.333	2.083	95.046			
13	.271	1.694	96.740			
14	.236	1.473	98.213			
15	.198	1.235	99.448			
16	.088	.552	100.000			

Extraction Method: Principal Component Analysis.

However, upon closer examination, the three-factor solution appeared problematic. The third component, despite explaining a significant portion of the variance, did not present a clear pattern in terms of factor loadings. This lack of clarity in the third factor suggests that it may not represent a distinct or interpretable construct within the context of sustainable travel behaviors and attitudes.

Rotated Component Matrix<sup>a</sup>

	Component		
	1	2	3
Have you changed your travel behavior due to climate change?		.527	.512
Is preserving the local economy, society, and nature during your trip important to you?		.337	.558

What do you think of this concept? Refill dish			862

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 5 iterations.

As a result of an unclear structure of component 3, a 2-factor solution was attempted and the factor loadings are presented below (with Varimax rotation).

_	Component	
	1	2
Have you changed your travel behavior due to climate change?	.490	
Is preserving the local economy, society, and nature during your trip important to you?	.478	
Do you support hotels, restaurants, and service providers in implementing sustainable measures?	.621	
Would second-hand furniture in your hotel room diminish your travel experience?		.746
Are you aware of the measures accomodations, restaurants and service-providers undertake for more sustainability?	.688	ALO.
Do you wish for more transparency from accomodations, restaurants and service providers regarding sustainable measures?	.708	)
Are you aware of your ecological footprint when traveling?	.732	
Would you like to know your ecological footprint when traveling?	.707	
Are you aware of the impacts of food waste?	.664	
Are you familiar with the circular economy and its various models?	.493	
Are you interested in participating in activities and services related to circular economy (Recycling and reusing materials) during your trip?	.760	
Would you like the option to have your leftovers packed and taken with you from restaurants?	.573	
Would you have a problem if your leftovers were used later for other purposes?	.309	
What do you think of the concept in hotels of only receiving fresh towels if	.445	
they are left on the floor?		
What do you think of circular economy models in tourism?	.819	
What do you think of this concept? Refill dish		.809

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 3 iterations.

Further complicating the factor structure was the second component, which included only two items with significant loadings. The reliability analysis for this component yielded a Cronbach's alpha of .482, indicating poor internal consistency. In psychometric terms, this low reliability suggests that the items within this component do not cohesively measure a single underlying construct. A Cronbach's alpha below the commonly accepted threshold of .70 is generally considered indicative of a scale that is not reliably measuring a consistent construct.

Reliability Statis	tics
Cronbach's	
Alpha	N of Items
.482	2

In contrast, the first component demonstrated strong internal consistency, with a Cronbach's alpha of .872 across 14 items. This high level of reliability indicates that the first component represents a cohesive and reliable construct within the survey, likely capturing a broad aspect of attitudes and behaviors related to sustainable travel.

Reliability Statis	tics
Cronbach's	
Alpha	N of Items
.872	14

In summary, the PCA and reliability analyses reveal that while one component of the survey demonstrates strong internal consistency and cohesiveness, the other components, particularly the third, do not exhibit a clear or reliable pattern. This suggests that the three-factor solution, as initially proposed, is not an optimal representation of the data. The lack of clarity and reliability in the third component indicates that it may not be a distinct factor, and the low reliability of the second component suggests it does not consistently measure a specific aspect of sustainable travel behavior. These findings highlight the complexities inherent in capturing attitudes and behaviors related to sustainability in tourism. The strong internal consistency of the first component, however, suggests it is a robust measure within the context of this survey.

A suggestion for a name for component 1 would be 'Sustainability Awareness and Advocacy'.

## **Comparative Analysis**

The 'Sustainability Awareness and Advocacy' index was created by averaging all items that compose the scale. First, the distribution of the scale was assessed using Kolmogorov-Smirnov test, which indicated that the scale follows a normal distribution (KS = 0.125, p = 0.154). One-way ANOVAs were conducted to examine if there are relationships between the scale and several factors under study such as gender, age, etc. Pairwise T-test were used to assess pairwise differences within each single category. The table below shows descriptive statistics for 'Sustainability Awareness and Advocacy' disaggregated by different factors. The table contains means, standard deviations, standard error for the means and 95% confidence intervals for the means.

Note: Values in the same column and subtable not sharing the same subscript are significantly different at p < .05 in the two-sided test of equality for column means. Cells with no subscript are not included in the test.

- 1. This category is not used in comparisons because the sum of case weights is less than two.
- 2. This category is not used in comparisons because there are no other valid categories to compare

The table presents data on sustainability awareness and advocacy among individuals in various contexts, with significant findings in specific areas. In the comparison of sustainability awareness within one's country and continent, participants who quoted trips within these contexts scored higher than those who did not, with F values of 3.933 (p = .035) and 6.880 (p = .010) respectively.

Regarding self-rated travel behavior concerning sustainability, a significant difference was observed, with F = 9.998 and p = .002. Participants who rated their travel behavior as very sustainable or rather sustainable demonstrated higher sustainability awareness compared to other groups. This suggests that individuals' perceptions of their sustainability in travel correlate with higher advocacy and awareness levels.

The assessment of the commitment of hotels, restaurants, and service providers to sustainability showed significant variance in perceptions, with a F value of 12.025 and p = .001. Participants' views on the commitment level significantly differed, indicating varied perceptions of sustainability efforts in the tourism sector.

Familiarity with food-sharing apps was associated with higher sustainability awareness and advocacy, with a significant F value of 5.032 and p = .028. This finding suggests a link between engagement with circular economy practices and enhanced sustainability consciousness.

Preferences for renting and sharing over owning were significant, with F values of 4.610 (p = .035) for the preference to borrow/rent items and 8.969 (p = .004) for the general concept of renting/sharing. These results indicate a preference shift towards more sustainable consumption practices during vacations.

Income level was significantly related to sustainability awareness and advocacy, with lower income groups demonstrating higher sustainability scores compared to higher income groups (F = 6.804, p = .011), indicating that sustainability awareness and advocacy are not exclusively influenced by economic status.

Overall, the table's data reveal significant differences in sustainability awareness and advocacy across different contexts, indicating a complex relationship between geographical context, personal

sustainability perceptions, engagement with circular economy practices, and economic status in shaping individuals' sustainability awareness and advocacy.
